

Update instructions:

If you want to update from version 1.3 or later you can update it according to this documentation. If you are using earlier versions, you need to install the system from scratch.

There are two ways to update your website to the latest version:

- Fresh installation: You can install the updated version from scratch according to installation instructions. Your data will be lost.
- Upgrade the existing version to the latest version without losing data.

Very Important:

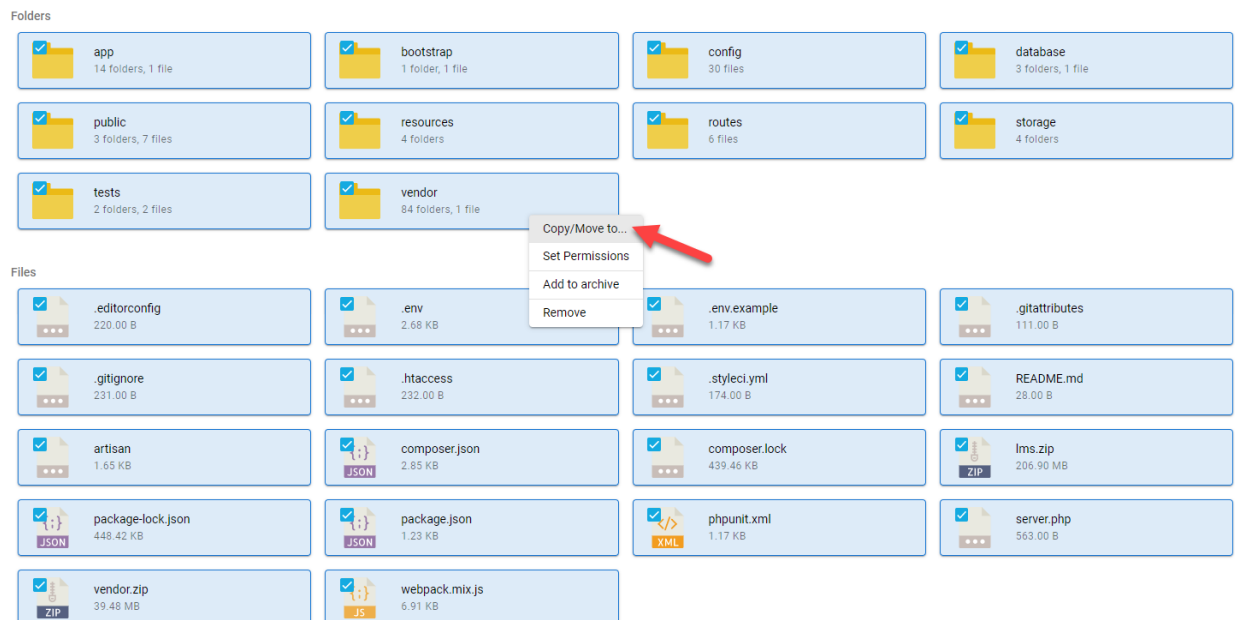

Make sure to submit your license in CRM before the update process to avoid any problems after updating. ([How to](#))

Update Database

Before everything, if you want to keep your old data, please send your database in CRM to update it for you. (Please check step #4). After getting the updated database, you can go ahead with the update process.

How to upgrade to the latest version without losing data?

Step 1: Open your hosting file manager and move all of your website folders and files to a new folder. (e.g. oldfiles).

Step 2: Upload the “Update.zip” that exists in the downloaded package (Update/Update files/Update.zip) file to your host and extract it in your domain folder (In most cases public_html).

Step 3: Go to your “old files” folder created in step #1 and copy the following files or folders from your old version to the new version:

Type (Folder/File)	Path
File	Oldfiles/.env
File	Oldfiles/.htaccess
File	Oldfiles/public/.htaccess
Folder	Oldfiles/resources/lang Note: If you haven’t translated the platform and are using original language files, no need to copy these files. If you translated the platform, you need to copy your translations from the “Oldfiles/resources/lang” to your new version.
Folder	Oldfiles/public/store

You can request update service from [this link](#). Our developers will update your website. (Paid Service)

Note: You can download the latest version from Codecanyon. If you purchased the plugin bundle, you can create a ticket in our CRM and get the full package; by using this package, no need to install plugins separately.

Step 4: The database structure changes in updates mostly. If you don’t have data on your website and use it with the demo data, you can import databases included in the package so you will have a website the same as our live demo.

If your website includes functional data like users, courses, etc, you need to transfer your old database data to the new database.

You can transfer your data using tools like Navicat or contact support, we will transform your old database to the new database. This is a free service for users who use version 1.6.

Important:

You might be asked for license activation after updating the system. You can create a new ticket in CRM to receive your license file.

We added the auto-update feature to v1.7 so after updating your platform to v1.7, you can update your platform from the admin panel. Both database and code will be updated from the admin panel.
